Application Services

JD Edwards Software Implementation and Upgrade Services

JD Edwards Consulting Services from Spectrum Resources provide companies with complete end to end solutions for integration and implementation of Oracle's JD Edwards World and EnterpriseOne applications suites. Services range from business functional analysis to detailed design and programming. For EnterpriseOne, a variety of CNC related services are available, including 24 X 7 network support.

BPCS/LX Software Implementation and Upgrade Services

Spectrum's Practice Manager and BPCS Implementation Team have 25 years experience supporting Infor (SSA) clients in a five state area. Headquartered in Kansas City, we have the resources to provide a complete solution to our clients including installation, upgrades, and enhancements in functionality. This includes support for all releases of BPCS, including BPCS/LX.

AS/400 (iSeries) Legacy Application Support

Many companies strive to maintain their AS/400 RPG based investment while they simultaneously expand their AS/400 Internet presence with web based technologies such as Java, MySQL, and PHP. Legacy Application Support provides both traditional RPG programming and the latest web development application services.

Web Development and Internet Based Application Services

The Internet has "opened up" the business window to the world. Web Development Services are designed to help companies implement Internet applications using the most efficient tools available. Development software employed with these services includes Dreamweaver, Microsoft Visual Studio, Zend Studio, Eclipse, PowerBuilder, Macromedia MX Suite and languages such as PHP, ASP/ASP.Net, Java/JavaScript, SharePoint, XML and Flash.

ERP Software Selection Consultation

Spectrum maintains a significant investment in staff experienced with Oracle's JD Edwards brands and Infor's BPCS and LX brands. Consultation for other software solutions such as SAP, Lawson/Intentia, and MAPICS is also available.

Infrastructure Services

Enterprise Data Backup / Restore Planning and Consulting

The increasing dependency on 24 X 7 operations with near-zero downtime requires a carefully architected IT Business Continuity Plan. Spectrum's Business Continuity Services provide planning and consulting for Enterprise Level back-up of critical information, including real-time data replication, disaster recovery, and high systems availability.

IT Server Analysis and Planning

Preventing server sprawl is a never-ending challenge for most companies. Spectrum provides an in-depth variety of services designed to minimize server inventory by carefully analyzing server utilization and performance. Based on our analysis, Spectrum provides recommendations which typically lead to server and storage consolidation of up to 40%.

IT Security Analysis and Planning

Spectrum offers multiple levels of Information Security Services including restricted access, encryption services, data protection, and contingency planning. A comprehensive IT Security Plan is one of the most commonly requested CIO requirements. It can be a challenging project and usually requires a formal analysis and implementation plan.

IT Assessment and Audit

From a CIO's perspective, an IT Assessment and Audit engagement can produce significant improvements in IT effectiveness. Services are designed to highlight the steps that can be taken to improve utilization of facilities, hardware and software systems, applications, development and operational staffing, support and management planning processes.

IT Education and Training

Services are tailored to a client's unique requirements and will depend on the current skill level vs. desired skill level for each student and topic. Curriculums are available for most of the Spectrum Resources services, often in a skills transfer environment in conjunction with the actual implementation and delivery of the Spectrum service being provided.

IT Concerns and Issues Check List

- Dealing with Expanding IT Software Backlog
- IT Staff Resource Utilization – doing more with less
- Improving End-User Transaction Response Times
- Improving End-User Information Availability
- Implementing Software Release Upgrades
- Providing Tighter Application / Data Security
